

TensorFlow Exercise

1. In today's exercise we will build a neural network to predict avocado prices from the following dataset:
[Avocado Prices | Kaggle](#)
2. We can use **TensorFlow** only (no Keras today), and build a neural network of as many layers as we wish. Use a GradientTape to store the gradients.
3. We can play with the learning rate, and play with any other parameter we want
4. May the best Network win

Good Luck!
